

Pro -

spektif

On 12 June 2026 Ger planned to make an evolving installation “Pro-spektif”, that imagines a sustainable world in the year 2260.

Through eighteen interconnected panels, music, light, film and performances “Pro-spektif” invites visitors to imagine a future shaped by creativity instead of fear.

The inner circle has a diameter of 150 cm and exists of 5 panels of 60 cm wide and 2,4 m high. One panel has a window (60x80cm). Two panels show one of the world parts and one shows the oceans. Two are free for new inspiration.

The central circle has a diameter of 3,5m and exists of 5 panels of 1,5 m wide and 2,30 m high. Two panels have a window (60x80cm). Three panels show one of the world parts and one shows the oceans. One is still open.

The outer circle has a diameter of 4,5m and exists of 8 panels of 1,5 m wide and 2,20 m high. Three panels have a window (60x80cm). Three panels

show one of the world parts and one shows the oceans. Four are still free for new inspiration.

But all this can easily change if new ideas raise up.

The idea is to make music and light projections part of the installation. Members of kollektif might contribute with music, light, text, interviews, films, performances, presentations or otherwise. But also, other interested persons or organisations can propose activities or share ideas.

The aim of this work is to generate discussion and stimulate positive ideas for the future.

The work asks not what the future will be, but what future we choose to create.

Many changes in society will however occur without human steering.

Warning: Not all new ideas in this fantasy would be accepted conform the norms of the year 2026.

To invite you to participate in this installation, the pdf- document 'A sustainable world' is published on the website www.kollektif.pt.

A

sustainable

world

In 2026 there were 8,5 billion humans.

After a combination of dramatic events, such as pandemics; decrease of the quality of sperm cells due to poisonous chemicals; climate change with drought, hurricanes, floods, higher sea levels; wars and positive and negative politics, the world reached finally a sustainable balance in the year 2260.

1. Population and their environment

In the year 2260 there is a sustainable human world population, with 2,5 billion people that live in areas decided by the decisionmakers (see chapter 6).

Before decisions are made, referendums are organised with AI assisted scenarios, after reviewing the population.

The decisions are made taking in account the effects of climate change, attractiveness of cities and environment, food possibilities, availability of energy, space for cattle, and space for nature.

There are urban areas, parts with cattle for food, parts of nature with human entrance, and in all 6 world regions huge parts of nature with very little limited human interventions. In these natural areas complete eco-systems can develop without any human influence.

60.000.000 km² of the world land surface has a natural ecology with no influence of humans except for science and for very limited tourism (as far as it does not do any harm).

As there are far less people on the world, there is an enormous space in cities for all kind of activities such as work, art, music, sport and games. People can choose to live in the most beautiful buildings and demolish the ugly ones. Monumental churches and other architectural structures are used as music halls and exposition rooms.

People may choose to live in one of the beautiful old cities and there is an enormous space for people that like to live in the countryside.

2. Government

In 2080 after dramatic events worldwide, the ‘*world constitution*’ is determined. The constitution is based on the Charter of the United Nations from 1948 especially with special attention for the Human Rights. In the constitution is stated that all humans have equal basic rights.

In an annex also animal rights are formulated.

There are independent courts and freedom of press is guaranteed.

There will be a new form of democracy, aimed on policies (strategies and tactical decisions) for the long term.

There is only one army on the world.

2,5 billion people is 2.500 million humans. Per million inhabitants there is one decisionmaker democratic appointed by elections in every part of the world (see below), so there will be 2.500 decisionmakers in the world. Decisionmakers are appointed for 10 years. Elections will be held based on one vote per adult individual human.

The tasks of the decisionmakers are:

- **Organize the wellbeing of the population in the 6 parts of the world. The decisionmakers fulfil their work in their own part of the world but do this in agreement with the other world parts.**
- **Organise the wellbeing of the general world population in meetings between the decisionmakers from the different parts of the world.**
- **Inform the population.**
- **Obtaining support from the population.**
- **Selecting a world council of 90 members.**
- **Guiding the strictly execution of the constitution and the annex.**

The decisionmakers need to fulfil to the following 6 criteria:

- a. **Integrity**
- b. **Knowledge needed to serve the public interests by managing public services.**
- c. **Proven motivation to serve the public interests**
- d. ...
- e. ...
- f. ...

The criteria d, e and f can be decided in the democratic elections.

The decisionmakers take decisions with a majority of 2/3 of the votes.

The decisionmakers will be appointed in such a way that every year there will be some new members. Decisionmakers can create ministries and other organisation-forms within their part of the world.

Every 5 year there is a referendum worldwide with different scenarios for an ideal society, after reviewing the population. And in every region of the world the decisionmakers organise referendums about regional and local issues, prepared with AI to offer the best different scenarios.

The members of the world council are selected for 5 years. The world council has the monopoly for giving permission for the use of arms worldwide.

They are responsible for the police tasks as well as the military tasks.

They have an advisory task to support the decisionmakers in other matters.

The members take decisions with 2/3 of the votes (67 members must support the decisions).

They will be appointed in such a way that every year there will be some new members.

The maximum amount of council members in one world part is 30. The reason for this is that otherwise the world power would be too much in one part of the world. The minimum amount is 5 members to avoid being overpowered by other world parts.

Members of the world council earn 25 times the basic amount (see chapter 8), decisionmakers 20 times. All other salaries in the world are not higher than 15 times the basic amount.

3. Artificial Intelligence

During a period from 2025 until 2150 AI has been filled with the input from 10 billion people and after 2050 with a reduced number of humans, but with increased knowledge by AI.

All scientific knowledge has been combined and from billions of people is known what they feel, what they need, and in what they are interested in. With assistance of AI an enormous amount of information can be combined in a way that a human brain never can.

With assistance of AI all scientific knowledge about influencing the human mind is used to inform the population and to get support of the population. Diversity of thoughts and opinions is much more limited than in 2026.

In 2026 and following years important facts with big social impact (effects of pollution on nature, overpopulation, climate change, etc.) were politicized, which led to stagnation.

Internet was used by cowards for anonymously abusing people and for criminal activities. In 2029 the European Community decided that every person who publishes something on the internet can be traced by EIC (European Internet Control). Based on complaints of victims a publisher may be asked to give a reaction. He/she might be punished to pay a compensation, a fine, or will be brought before court.

Around 2035 the United Nations agreed to depoliticize AI, as people were too much manipulated by governments and other institutes. Science is since then elevated as an important contribution to the realisation of a fact-based reality. In 2037 there was international support for worldwide democratic elections to decide which scientific results will be worldwide considered as facts for political decisions. The scientific

results are considered as facts if 60% of the voters is also positive about that. These results are also input for AI systems.

In the last century, as a logical result of the goal for a fact-based reality, religion faded away out of society. Nowadays only small remnants are left and are popular for tourists. Many former religious buildings are world heritage now. Religious music is considered classic and still an inspiration for many musicians. Many churches are now used as music halls.

With AI the knowledge in science, of environmental effects on humans, of energy efficiency, and knowledge in many other fields has led to new crucial knowledge to solve many problems that existed in the world in the year 2026. Knowledge that goes far beyond the possibilities of a human brain.

In 2260 in medical science the functions of genes and peptides are combined with AI, and many medical and social problems are solved.

The world has been robotized with AI programs and many jobs that were fulfilled in 2026 are now executed by robots.

Humans now have much more time for other activities than labour. With new AI-assisted projectors every thinkable image or story can be produced. As a result of this, sexual taboos diminished and nudity has become normal on beaches and everywhere this is convenient.

Nudistas, bemvindo no ano 2260

There are many sport facilities available as well as music halls, art expositions, game halls, erotic centres, and museums. Erotic centres are facilitated with AI programmed sex games and humanlike robots.

4. Energy

Energy is fully sustainable by nuclear fusion factories, sun power, wind, hydro- and geothermal energy. With the assistance of AI an optimum balance is realized between hydro- sun- wind- nuclear (fusion) and other sources at the one side and the populated locations at the other side.

The energy costs are reduced to 20% of the costs in 2026.

In the year 2101 nuclear fusion reactors produced for the first time cheaper energy than wind energy. The waste of older nuclear reactors is used for fuel for nuclear fusion reactors.

Public transport is cheaper than ever before.

5. Food

Food is produced without chemicals that are unhealthy for the environment. Around populated areas there are locations for biological agriculture and for cattle.

Cattle are held in natural parks, with circumstances as close to normal natural animal behaviour as possible. Herds of cows with some bulls and calves that stay with the cows until they are grown up. Animals are only killed in an animal friendly way, based on scientific research.

With the assistance of AI, a system has been developed in which every individual knows exactly which specific food is on a specific moment helpful for a good health.

6. Nature

Biodiversity is now protected in the constitution.

In every part of the world, in total 40% of the land surface, there are huge parks where complete eco-systems can develop without any human interference. Science and limited possibilities to observe this natural environment are allowed.

Around the populated areas there are rings with agriculture and nature in which cattle can live in a natural way. These natural parks are in total 20% of the land surface and they are open for public.

With assistance of AI new ways are found to reduce the number of poisonous materials in the environment (in water and land). For example, bacteria eat pfas in water and die.

50% of the oceans is free of human influences (including traffic), except for scientific research. Noise and pollution are very limited in the other 50%.

The quality of the air and the water is dramatically improved in 2260.

The quality of the air has been successfully improved since the new filter systems worked for some decades.

7. Society

In the constitution is stated that all humans have equal basic rights. There are independent courts and freedom of press is guaranteed.

Basic school is free for all children with classes of at maximum 25 children.

Education (vocational and other programs at all levels) is free of political and religious influences and is free of charge and with the assistance of AI linked to the competences of individual persons.

Research at universities is financed by the government.

Medical and social care are free. Anti-conception articles are free of costs worldwide available. The norm for families is to plan two children, to keep the world sustainable. But it is free to aim for more children on your own costs.

For families with 1 or 2 children all costs are compensated: creche, school, medical costs, loss of salary during pregnancy and the first year of the child.

In 2260 there is very specific information about the development of the embryo's brain during all phases of pregnancy, which prevents many future medical and mental problems.

There are luxurious wellness resorts in the most attractive parts of the world, free of charge for women that are pregnant for 6 months until birth. There is specialised medical and social care, healthy food (for every individual person) and circumstances that are optimal for the development of the brain and body of the individual embryo. This reduces the number of illnesses and gives newborns an optimal start in life.

Also, by using AI many diseases and medical problems that were a burden in 2026, are absent in 2260.

Gene technology (for example crispr/cas) with assistance of AI, new knowledge of functions of different combinations of hormones with assistance of AI, and many other scientific developments has led to a healthier population that live on average 20 years longer than in 2026.

With 2,5 billion people there are far less tensions in the world. In our current systems wars are impossible, so there is a sense of basic safety. People regained trust in each other and are much happier than a century ago.

Crime is reduced dramatically since in 2051 the genes were found that are responsible for the development of human conscience. A genetical lack of some combinations of peptides and hormones used to cause a large part of crime in the past.

Problematic viruses are reduced by genetic manipulation: they are genetic modified and die.

There is no poverty anymore in the world.

The costs for military and police tasks are since 2026 reduced to 10 %.

Families that had to leave areas are fully compensated with an average house suitable for 4 persons on (as far as they would like it) minimum 500 m² land in any populated part of the world, with free education and/or a job that fits to the competences of the individual person.

Since 2040 all odours can be reproduced using AI. The odour of the flowers of Albizia, the “tree of joy”, became very popular that year. There were many gardens full of Albizia, with large balconies above the trees. These were filled with visitors of Albizia lounge-bars that served different Albizia drinks with an up-lifting effect.

Nowadays human odours are also used for medical analysis.

In 2026 the Netherlands were responsible for the International Court of Justice, that was situated in The Hague. But the Dutch government did not protect this institute. In the following years the influence of international law and of the International Courts declined.

After some wars ended in the years 2029 and 2030 common sense led to the idea that international justice should be leading again for all governments, to prevent wars. Wars per definition always only lead to devastating results.

The international Court of Justice received full power again in 2033.

Putin, Trump, Netanyahu and his minister Ben-Gvir are convicted in 2034 by the International Court of Justice in Den Hague for war crimes. Trump died before the verdict, Netanyahu got Alzheimer and Putin and Ben-Gvir died in prison.

Since 2090 the world council is responsible for the development of international law, after consulting the population (see chapter 2).

Criminals are not punished in prisons anymore. Some are not allowed to be part of society anymore, but they have (separated in a protected area) possibilities to develop themselves and even contribute to society. They have the right of access to psychological and psychiatric support and possibilities to work and study. They are allowed to be visited by relatives and friends.

8. Economy

In 2047 a large group of countries that strictly fulfilled all norms concerning:

- democracy
- independent courts
- freedom of press
- equal rights for every individual
- gender equality

- animal rights
- environment

agreed on the *rainbow-treaty*. In the rainbow treaty nations

agreed to strictly fulfil all rainbow norms. The members promote trade within the rainbow nations and avoid as much as possible trade with autocratic states. Countries that like to join the rainbow nations are welcome.

The rainbow countries cooperate in military matters and develop together an adequate defence system against external violence.

The international rainbow court of justice decides whether countries fulfil all rainbow norms.

Immigrants in the rainbow states are welcome if they subscribe the rainbow norms.

Through the rainbow treaty the world slowly developed the system that would be operational in 2080 with the world constitution (see page 4 Government).

Rainbow treaty 2047:

Europa
Ukraine
Canada
Austrália
New Zealand
Brasil
Costa Rica
Suriname
South Africa
Namibia
Japan
South Korea
Taiwan
India

Rainbow treaty 2075 new members:

United States
Panama
Argentina
Nepal
Armenia
Israel
Syrie
Jordania
Tanzania
Botswana
Thailand
Vietnam
Malaisia
Papua Nieuw Guinea

New members Rainbow treaty 2112:

Marocco
Tunesia
Angola
Mauretania
Ghana
Zimbabwe

Madagascar
Mexico
Guyana
Cuba
Chili

The remaining countries also realised economic treaties, but they were far less successful as the Rainbow treaty. The Rainbow countries had in 2125 a much richer and happier population than the rest of the world. Therefore, during time more countries wanted to join the treaty. In 2080 the *World Constitution* has been established and covered the whole world.

The economy is highly strengthened using AI. Many tasks are fulfilled with robots or are realised with far more efficiency than in 2026. There is much more time for other pleasures than work.

Personnel are very scarce and therefore labour is very valuable. All organization within society have employee-boards with the right of consultation concerning specific decisions.

There is one currency in the world: the “**multiplier**”, in daily us it is called the “MP” (“I paid 10 MP’s for it”).

This has made the financial systems far cheaper. And it has an enormous effect on administrative and other trade costs.

Since there is only one currency prices for consumers reduced.

Every individual will receive a basic amount, enough to pay all basic costs of life. People can earn extra income with work. Organisations only need to pay salaries above this basic amount.

Entrepreneurs may earn at maximum 15 times the basic amount. Employees in organisations earn salaries at maximum 12 times the basic amount. This is for 75% based on the impact of their tasks on the realisation of the goals of the organisation, added with 0% - 25% based on the contribution that the individual or organization has for society.

All salaries are taxed with 30 % to pay the governmental costs.

Energy is very cheap. For 2,5 billion people it was (with the assistance of AI) possible to make an effective energy plan for worldwide use of sustainable sources.

In 2066 a very expensive cleaning operation in the universe around the planet earth got rid of the many old satellites and other stuff. Since this year many rare metals are exploited on the moon. Nowadays there are some data centres and energy factories on the moon.

Housing for individuals as well as for organisations is very cheap. There are too many buildings, so already many are demolished and re-used, and more will be demolished in the future. There used to be a lot of ugly neighbourhoods in many cities all over the world. They all are demolished now, and large city parks are realized. These parks have a great effect on the climate in the urban areas, as they reduce the temperature on hot days.

The 6 World

regions

1.

Asia

- The current amount of the population in Asia is 4.900.000.000
- This is 58% of the world population.
- About 55% live in cities

- The total land surface is around 30.000.000 km²

Asia has in 2260 1,5 miljard human (60% van 2,5 miljard)

In Asia 1500 decisionmakers are democratic elected and 30 council members.

15.000. 000 km² is nature with very little limited human entrance (in such a way that nature can develop without any human influence).

2. Oceania

*(Australia, New Zealand,
Melanesie, Polynesie, Micronesia)*

- The current population of is 47.000.000
- This **0,55% of the world population.**

Oceania has a population of 15 million (0,6 % of 2,5 billion)

80% of the territory is nature with very little limited human entrance (in such a way that nature can develop without any human influence).

In Oceania 15 decisionmakers are democratic elected and 5 council members.

Oceania has an extra responsibility for the oceans worldwide.

3. Africa

- The population of Africa is in 2026: **1.600.000.000**.
- This 19% of the world population.
- The total land surface is around 30.000.000.
- 46% of the population live in 2026 in cities.

Africa has in 2260 a population of 500 million humans (20% of 2,5 billion).

15.000.000 km² is nature with very little limited human entrance (in such a way that nature can develop without any human influence).

In Africa 500 decisionmakers are democratic elected and 28 council members.

4. North America

- The population was in 2026: **390.000.000**

- This is **4,7%** of the world population.
- In 2026 83% of the population lived in cities.
- The total land surface is around 19.000.000 km²

North America has a population of 125 million humans (5% of 2,5 billion)

In North America 125 decisionmakers are democratic elected and 7 council members.

10.000.000 km² is nature with very little limited human entrance (in such a way that nature can develop without any human influence).

5. South America

- In 2026 the population of South America was 440.000.000.
- This is 5,3 % of the world population.
- In 2026 89% of the population lived in cities
- The total land surface is 17.500.000 km².

South America has a population of 140 million humans (5,6 % of 2,5 billion)

10.000.000 km² is nature with very little limited human entrance (in such a way that nature can develop without any human influence).

In South America 140 decisionmakers and 8 council members are democratic elected.

6. Europe

- In 2026 the population of Europe is 745.000.000.
- This is **9%** of the world population.
- In 2026 75% of the population lived in cities.
- The total land surface is 22.135.000 km².

In 2260 Europa has a population of 225 million humans (9% of 2,5 billion).

In Europe 225 decisionmakers are democratic elected and 12 council members.

5.000.000 km² is nature with very little limited human entrance (in such a way that nature can develop without any human influence).

15 sept 2026
